TREENA M. LYNCH

Spokane, WA | inquiry@unconvinced.ai | unconvinced.ai

Full-Stack Systems Developer · AI Integration & Automation · AI-Assisted Development & Testing

PROFILE

Full-stack systems developer with 20+ years building, debugging and supporting production software, from payment processing and ticketing to business-system automation. Now builds and ships apps with generative AI (ChatGPT, Claude), then tests what the AI built against requirements, edge cases and data integrity before it reaches users.

SKILLS

Development	C# • SQL • JavaScript • HTML/CSS • Relational data • Business automation • SuiteScript / NetSuite
AI-assisted delivery	ChatGPT • Claude • Prompt and context engineering • AI-directed implementation • AI output validation
Quality & support	Edge-case and failure testing • Acceptance criteria • Log analysis • Issue triage • Sandbox and deployment validation

EXPERIENCE

Unconvinced. | Founder, Independent Developer 2025–Present

- Ships consumer iOS apps built with AI: **Snapshot Puzzle**, **The Cut Card**, **Congress Trade Detective** and **Calm Coloring Book** (all live on the App Store); Blackjack Free Play.
- Directs generative AI through requirements, implementation, testing and release; owns workflows, acceptance criteria and release priorities.
- Tests AI-generated code against requirements, edge cases, data integrity and failure modes; uses logs to investigate behavior and challenge production-readiness assumptions.
- Built the Congress Trade Detective web presence and its long- and short-form content operation, now under the Unconvinced. brand, using AI for research, scripting, visuals and workflow automation under editorial review.
- Built The Room, an open-source workspace that puts Claude and an OpenAI model in one project conversation, with cross-review, shared rules and saved decisions (Next.js, TypeScript, SQLite, Anthropic and OpenAI APIs).

Cologix | Business Systems / NetSuite Developer 2021–2025

- Developed and maintained SuiteScripts supporting business operations and workflows.
- Diagnosed production issues across multiple environments through log analysis, testing and system validation; supported triage, debugging and documentation.
- Ran sandbox testing and deployment validation for changes; worked across teams on system reliability, reporting and data accuracy.

Huppins | NetSuite Developer 2018–2021

- Built and maintained SuiteScripts for pricing, inventory and operational workflows; supported troubleshooting, validation and system enhancements.

World Wide Group — Programmer, 2004-2018 (15 years)

- Sole developer behind a suite of in-house applications end to end: the point-of-sale system and dedicated apps for each major event (Family Reunion, Spring Fling, FED and others), the web services behind them, and all the SQL and database design they ran on. Owned every layer, and over 15 years modernized my own code as the platform evolved.
- Re-architected the legacy ticketing system over two years: decoupled payment from checkout so first-hour sales no longer overwhelmed the card processor — orders captured instantly as pending, then batch-charged through an admin app I built — with per-step status tracking (Authorizing to Authorized to Capturing to Captured) and a unified Cart/Order schema. Captured and balanced 10M+ transactions and $10M+ in payments a year.
- Rebuilt a failing POV system's local application and infrastructure.

EDUCATION

B.S., Information Technology | American InterContinental University

A.A.S., Information Technology | Spokane Community College
